

Evaluation of Techniques to Detect Wrong Interaction Based Trace Links

Motivation: Why Do We Need Another Trace Link Creation Approach?

- Our application context for trace links
 - Unstructured requirements in an issue tracking system (ITS)
 - Source code in a version control system
 - Direct usage of trace links during development
- Usage of trace links during the development requires good precision of trace links
 - Wrong links will prevent developers from using the links
 - Our prime research goal: **optimize precision up to 100%**
- Precision of existing trace link creation approaches is typically below 50%
 - Focus is the increase of recall to use trace links retrospectively (bad precision is tolerated)

Interaction based Trace Link Creation Approach (IL)

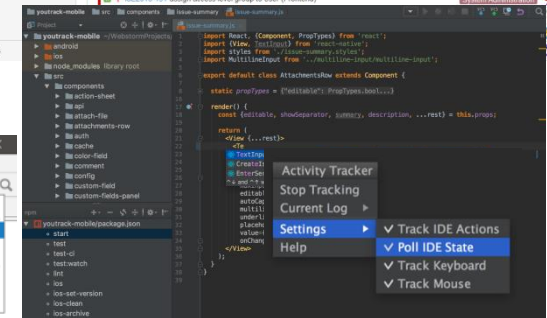

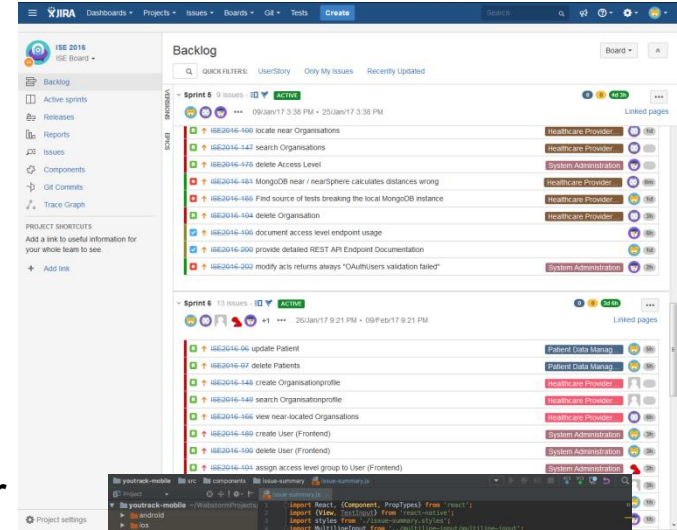

Evaluation of IL Approach

- RFESQ17: Study with open source project data
 - IL approach: **100% precision** and **~90% relative recall**
 - IR (VSM & LSI): in best cases **34% precision** and **53% relative recall**
- 2018: 2nd Study with student project data
 - Complete gold standard and real recall values
 - ... it turned out different
- The precision of created links was not as good as expected
 - IL approach: only **43% precision** and **73% recall**
 - IR (VSM & LSI): in best cases **34% precision** and **48% recall** (low thresholds)

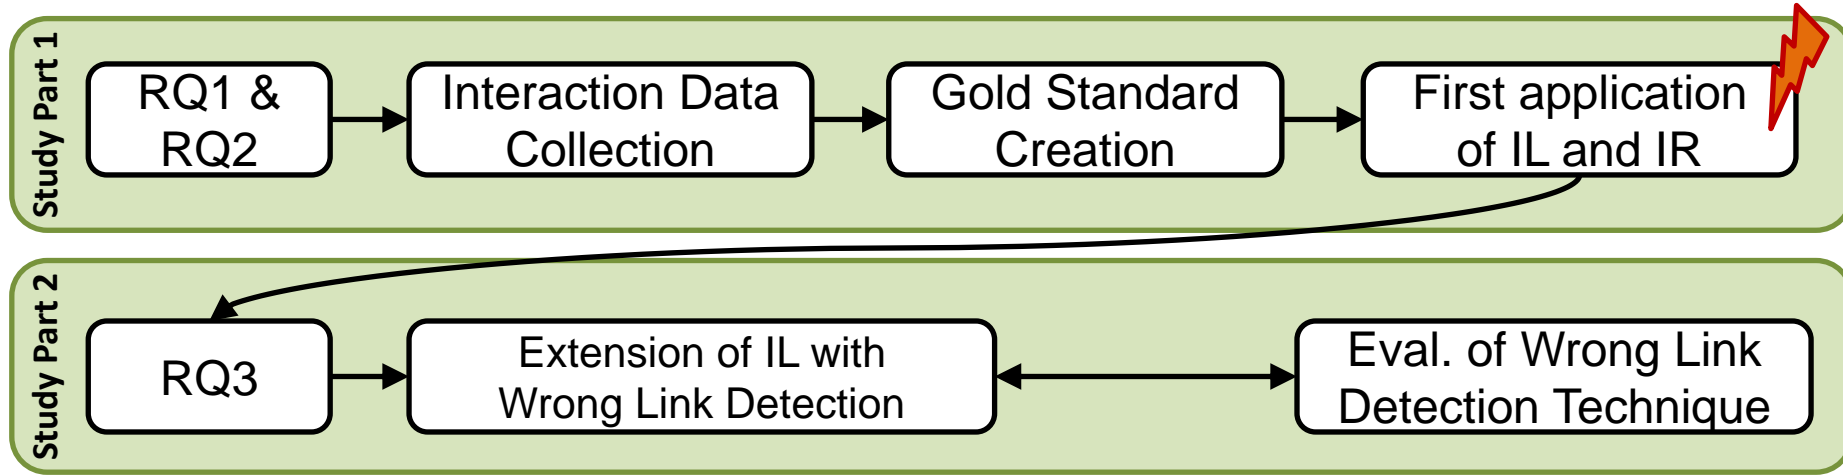

→ **New idea for this study:**
Evaluate different techniques
to avoid the creation of wrong
links

The Student Project

- 6 month (oct 2016 – mar 2017), scrum oriented with real world customer
- 7 sprints and 7 developers
- Development of an Open ID systems for patient healthcare data
- Infrastructure: Jira, Git, IntelliJ (Webstorm) IDE
- Interaction Tracking in IntelliJ by Activity Tracker
 - Manual selection of the issue worked on by developer

Experiment Design

RQ1: **Precision (P)** and **recall (R)** of **IL** created trace links?

RQ2: **P** and **R** of **IR** created trace links?

RQ3: P and R of IL created trace links **with wrong link detection techniques?**

Interaction Log Recording, Gold Standard Creation, RQ1 & RQ2

- Recorded Interactions during the project
 - ~2 Mio interactions between 42 user stories and 312 source code files
- Gold Standard created by link candidate questionnaire
 - 217 correct links between 19 user stories and 151 source code files
- Initial application of IL (RQ1 & RQ2):

Approach	Link Cand.	Correct links	Wrong links	Not found	Precision	Recall
IL	372	160	212	57	0.430	0.737
IR _{VSM(0.2)}	642	104	538	113	0.162	0.480
IR _{LSI(0.1)}	102	35	67	182	0.343	0.161

RQ3: Detection Techniques for Wrong Trace Links - Duration

Observations

- **Select interactions** create **more wrong** links than edit
- **Wrong** selects are based in the **IDE navigator** not in the code editor

→ Focus on edit interactions

Characteristics of wrong interactions

- **Duration:** interactions with **longer duration** are **more likely** to be **correct**
 - Get the duration based on the deltas of interaction timestamps
 - How to set the threshold value for duration?
 - Ensure that **no correct links get lost**
 - Use a **fixed value** (e.g. 2.0 sec) or **average value**

$$\text{duration}_{01} = \text{timestamp}_{02} - \text{timestamp}_{01}$$

$$\text{duration}_{01} = 28.720 \text{ sec}$$

```

    /WebstormProjects/ise/lib/patient_controller.js
```

RQ3: Detection Techniques for Wrong Trace Links - Frequency

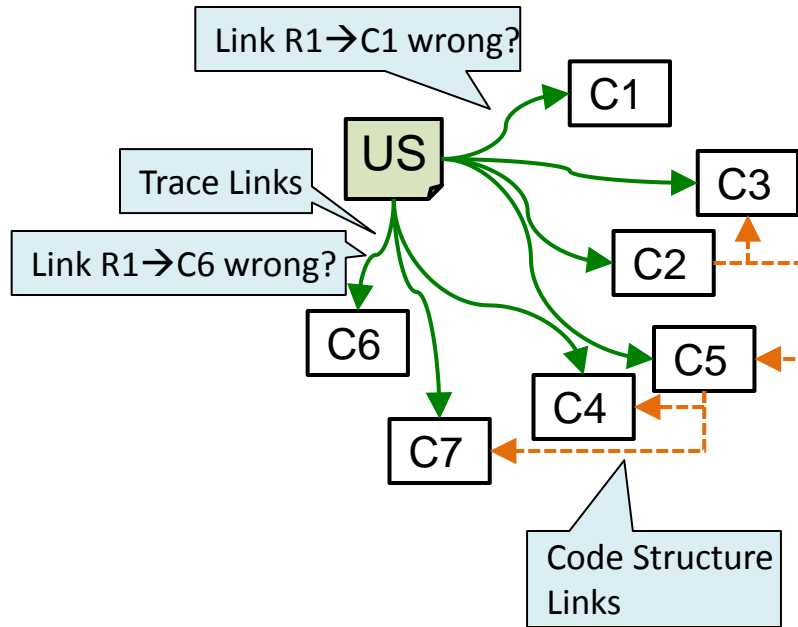

Characteristics of wrong interactions

- **Frequency:** links to **frequently interacted** files are **more likely** to be **correct**
 - Count the number of interactions with source code files during the implementation of a requirement

frequency for `patient_controller.js` in ISE2016-38 = 2

```

    ise;Dialog
```

RQ3: Detection Techniques for Wrong Trace Links – Code Connection for User Story

Use the source code structure for a user story

- Check if **source code files** are also **connected by the code structure**
- **Source Code Structure:** links to **connected code files** are **more likely** to be **correct**

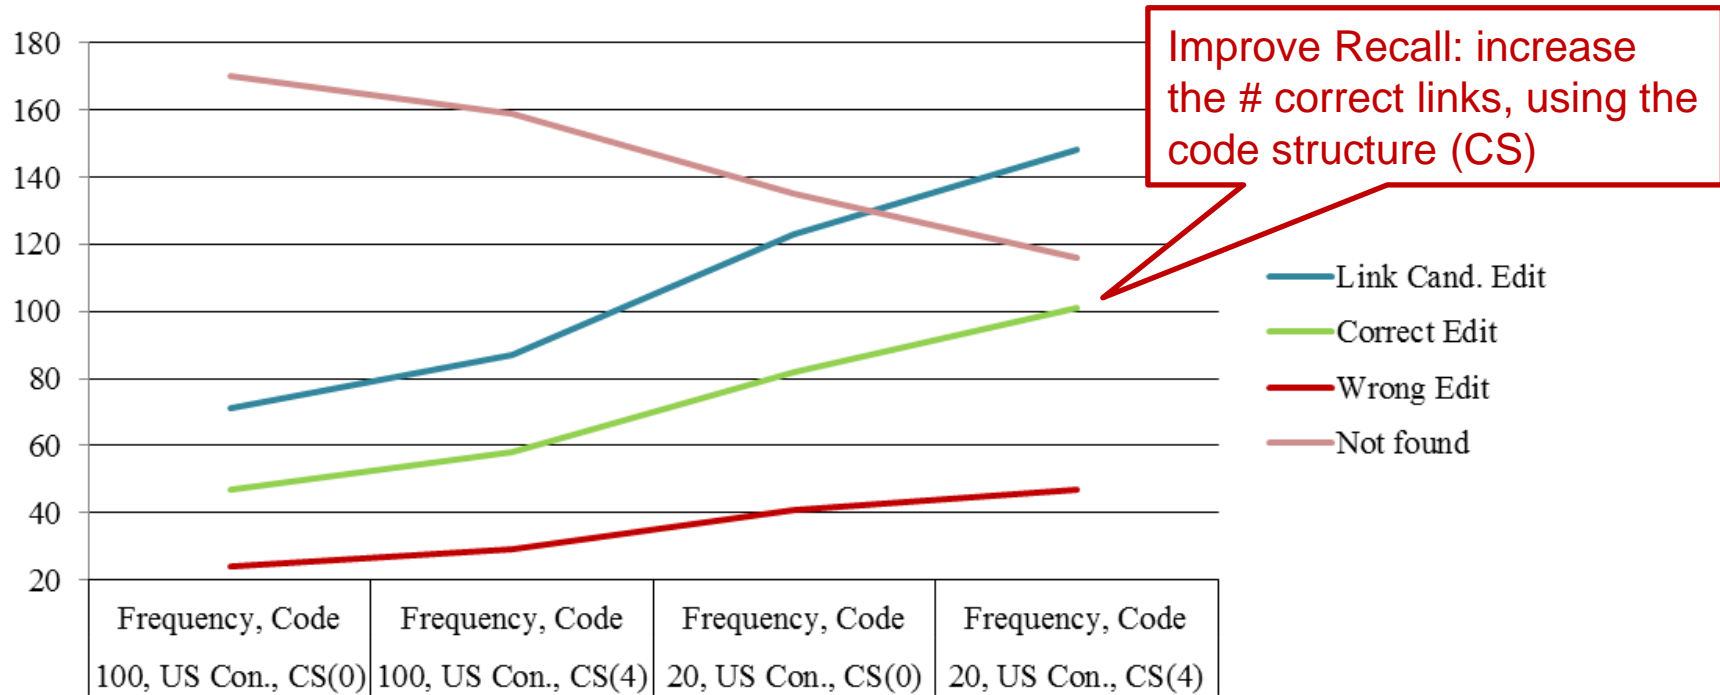

RQ3: Results for Application of Wrong Link Detection Techniques Improve Precision

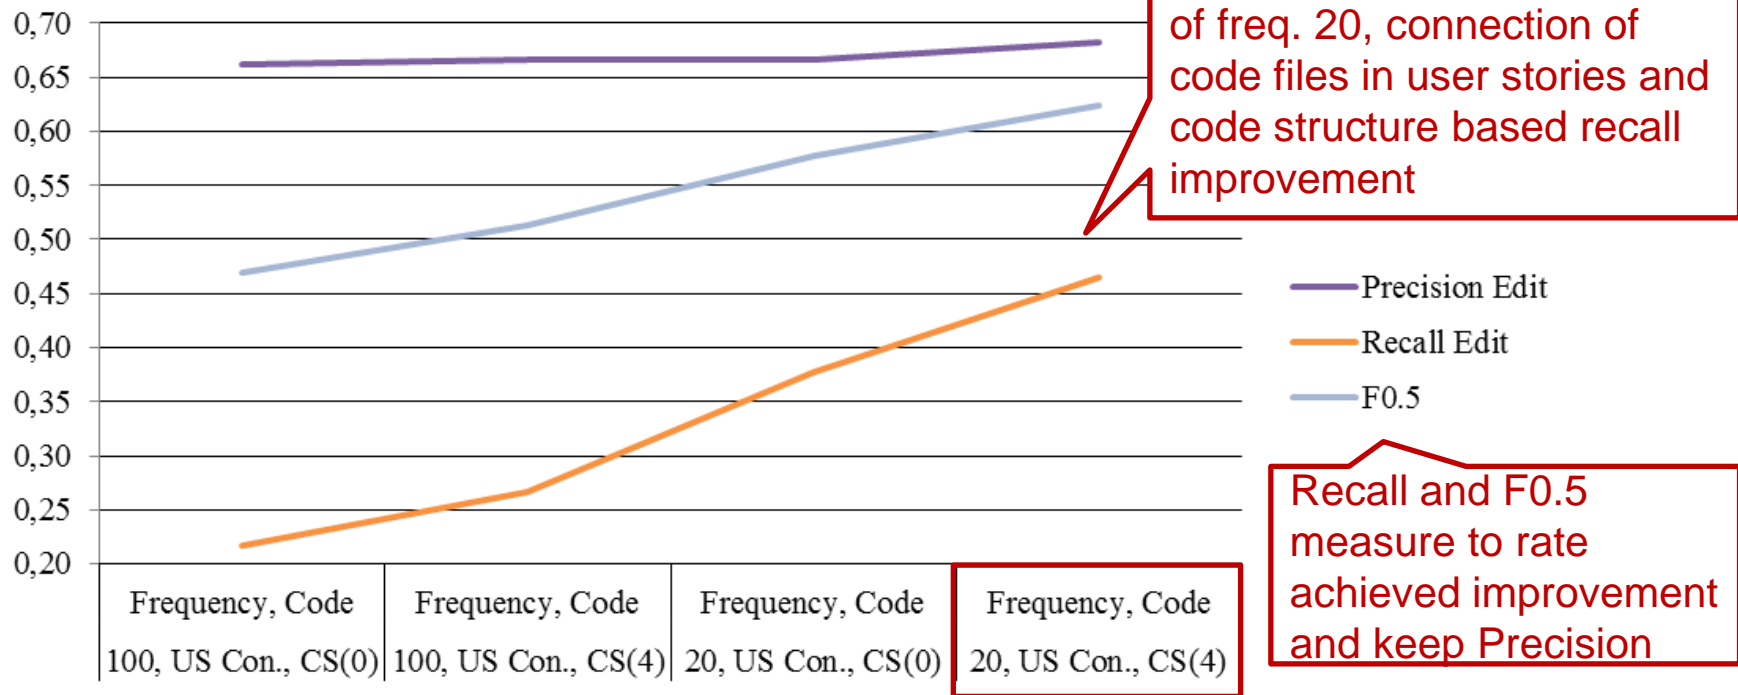

RQ3: Results Application of Wrong Link Detection Techniques Improve Precision

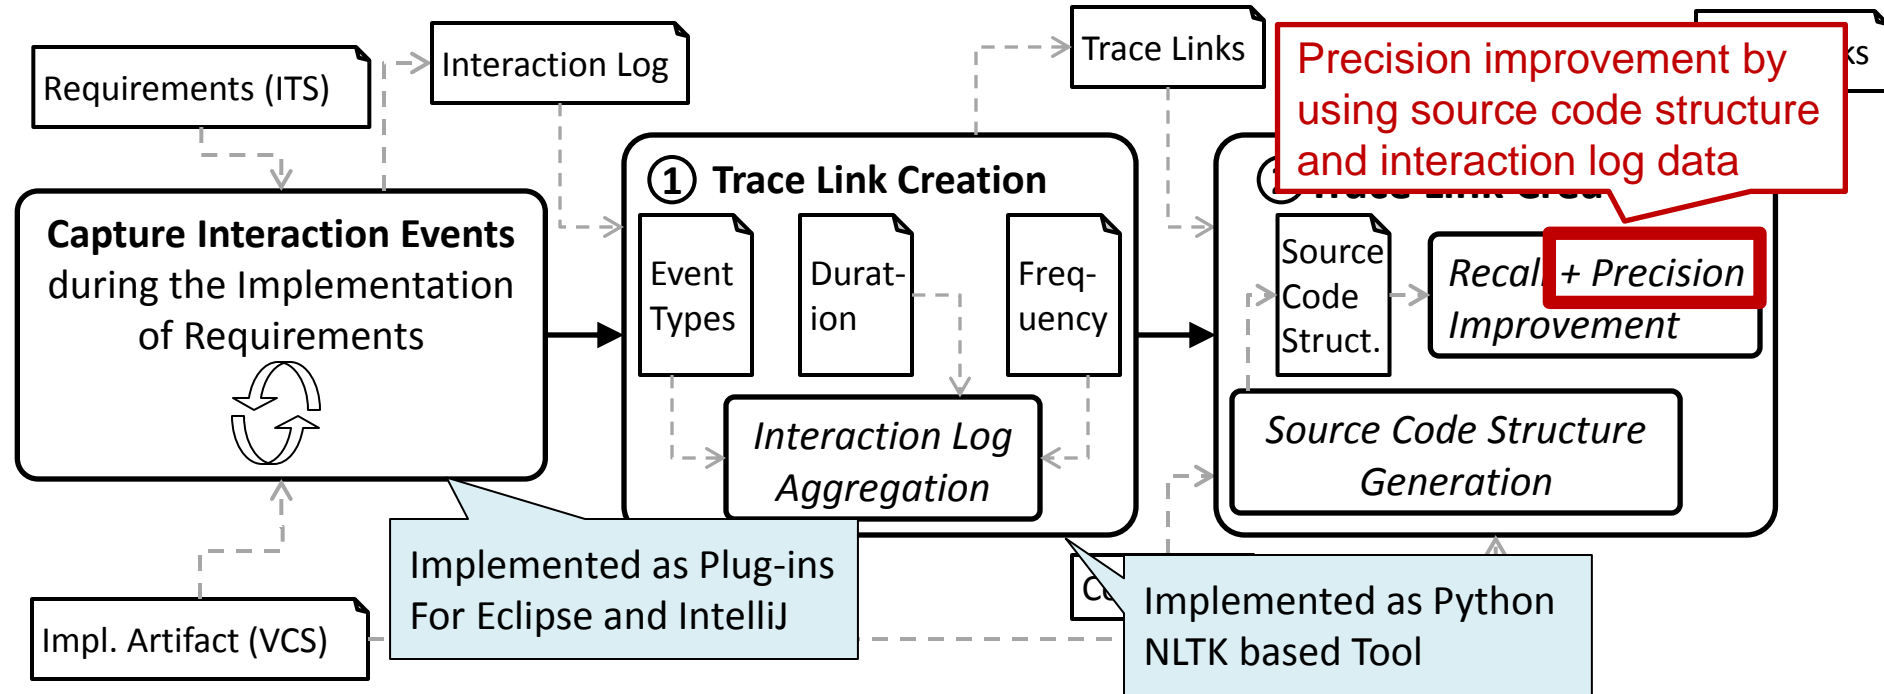

RQ3: Results Application of Wrong Link Detection Techniques Improve Precision and Recall

RQ3: Results Application of Wrong Link Detection Techniques Improve Precision and Recall

Extended IL Approach

Conclusion and Outlook

- IL performed insufficient in context of our student project
 - Developers have only little awareness of interaction logging effects
 - This might be the more common case in development projects
- Only frequency and removal of non-connected files improved the precision considerably up to almost 70%
- Further directions:
 - Support developers to apply interaction log recording more disciplined
 - Recommend the link candidates to the developers instead of automatic creation

Thank your for your attention!

Results: Source code file occurrence and developer specific differences

- 3 files with only wrong links (= bars with only red colors)
- #Developers touched a file differs (=marking in bars)
- Many link candidates → many correct links as well
- No pattern
- **In addition:** developer specific precision is similar
